Lecture 11
Euler-Lagrange Equations and their Extension to Multiple Functions and Multiple Derivatives in the integrand of the Functional

ME 256, Indian Institute of Science
Variational Methods and Structural Optimization
G. K. Ananthasuresh
Professor, Mechanical Engineering, Indian Institute of Science, Bangalore
suresh@mecheng.iisc.ernet.in
Outline of the lecture

Euler-Lagrange equations
Boundary conditions
Multiple functions
Multiple derivatives

What we will learn:
First variation + integration by parts + fundamental lemma = Euler-Lagrange equations
How to derive boundary conditions (essential and natural)
How to deal with multiple functions and multiple derivatives
Generality of Euler-Lagrange equations
The simplest functional, $F(y,y')$

Min $J = \int_{x_1}^{x_2} F(y(x), y'(x)) \, dx$

$$\delta_y J = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y + \frac{\partial F}{\partial y'} \delta y' \right\} \, dx = 0 \quad \text{First variation of } J \text{ w.r.t. } y(x).$$

The condition given above should hold good for any variation of $y(x)$, i.e., for any $\delta y$

But there is $\delta y'$, which we will get rid of it through integration by parts.
Integration by parts…

\[
\delta y J = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y + \frac{\partial F}{\partial y'} \delta y' \right\} dx = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y \right\} dx + \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y'} \delta y' \right\} dx = 0
\]

\[
\Rightarrow \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y \right\} dx + \frac{\partial F}{\partial y'} \delta y \bigg|_{x_1}^{x_2} - \int_{x_1}^{x_2} \left\{ \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) \delta y \right\} dx = 0
\]

\[
\Rightarrow \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) \right\} \delta y dx + \frac{\partial F}{\partial y'} \delta y \bigg|_{x_1}^{x_2} = 0
\]

We can invoke fundamental lemma of calculus of variations now.
The two terms are equated to zero because the first term depends on the entire function whereas the second term only on the value of the function at the ends.

\[ \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) \right\} \delta y \, dx + \left. \frac{\partial F}{\partial y'} \delta y \right|_{x_1}^{x_2} = 0 \]

\[ \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) \right\} \delta y \, dx = 0 \text{ and } \left. \frac{\partial F}{\partial y'} \delta y \right|_{x_1}^{x_2} = 0 \]

The integral should be zero for any value of \( \delta y \). So, by fundamental lemma (Lecture 10), the integrand should be zero at every point in the domain.
Boundary conditions

The algebraic sum of the two terms may be zero without the two terms being equal to zero individually. We will see those cases later. For now, we will take the general case of both terms individually being equal to zero.

Thus,

\[
\frac{\partial F}{\partial y'} \bigg|_{x_1} \delta y = 0
\]

\[
\Rightarrow \left( \frac{\partial F}{\partial y'} \bigg|_{x_2} - \frac{\partial F}{\partial y'} \bigg|_{x_1} \right) \delta y = 0
\]

\[
\frac{\partial F}{\partial y'} = 0 \quad \text{or} \quad \delta y = 0 \quad \text{at} \quad x = x_1
\]

and

\[
\frac{\partial F}{\partial y'} = 0 \quad \text{or} \quad \delta y = 0 \quad \text{at} \quad x = x_2
\]
Euler-Lagrange (EL) equation with boundary conditions

\[
\begin{align*}
\text{Problem statement} & \quad \text{Differential equation} & \quad \text{Boundary conditions} \\
\min_{y(x)} J &= \int_{x_1}^{x_2} F(y(x), y'(x)) \, dx & \frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) &= 0 \quad x \in (x_1, x_2) \\
& \text{and} & \frac{\partial F}{\partial y'} &= 0 \text{ or } \delta y = 0 \text{ at } x = x_1 \\
& \text{and} & \frac{\partial F}{\partial y'} &= 0 \text{ or } \delta y = 0 \text{ at } x = x_2
\end{align*}
\]
Example 1: a bar under axial load

Axial displacement = $u(x)$

Among all possible axial displacement functions, the one that minimizes $PE$ is the stable static equilibrium solution.

Principle of minimum potential energy ($PE$)

$$\text{Min PE} = \int_0^L \left( \frac{1}{2} E(x) A(x) \left( u'(x) \right)^2 - p(x) u(x) \right) dx$$

Data: $L, E(x), A(x), p(x)$
Bar problem: E-L equation

\[ \text{Min } \int_{0}^{L} \left( \frac{1}{2} E(x) A(x) \left( u'(x) \right)^2 - p(x) u(x) \right) \, dx \]

\[ F = \frac{1}{2} E(x) A(x) \left( u'(x) \right)^2 - p(x) u(x) \quad \text{Integrand of the PE} \]

\[ \frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) = 0 \quad x \in (0, L) \]

\[ \Rightarrow -p - \frac{d}{dx} \left( E A u' \right) \]

\[ \Rightarrow \left( E A u' \right)' + p = 0 \quad \text{Governing differential equation} \]
Bar problem: boundary conditions

$$\frac{\partial F}{\partial y'} = 0 \text{ or } \delta y = 0 \text{ at } x = x_1$$

and

$$\frac{\partial F}{\partial y'} = 0 \text{ or } \delta y = 0 \text{ at } x = x_2$$

$$F = \frac{1}{2} E(x)A(x)(u'(x))^2 - p(x) u(x)$$

This means that $y$ is specified; hence, its variation is zero. This is called the essential or Dirichlet boundary condition.

$$\delta u = 0$$

$$EAu' = 0 \text{ or } \delta u = 0 \text{ at } x = 0$$

and

$$EAu' \text{ or } \delta u = 0 \text{ at } x = L$$

This means that the stress is zero when the displacement is not specified. It is called the natural or Neumann boundary condition.
Weak form of the governing equation

\[
\min_{u(x)} PE = \int_0^L \left( \frac{1}{2} E(x) A(x) (u'(x))^2 - p(x) u(x) \right) dx
\]

\[
\delta y J = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y + \frac{\partial F}{\partial y'} \delta y' \right\} dx = 0 \quad \text{First variation is zero.}
\]

\[
\delta_u PE = \int_0^L \left( E(x) A(x) u'(x) \delta u' - p(x) \delta u \right) dx = 0 \quad \text{for any } \delta u
\]

\[
\int_0^L \left( E(x) A(x) u'(x) \delta u' \right) dx = \int_0^L \left( p(x) \delta u \right) dx
\]

Internal virtual work = external virtual work

\( \delta u \) Variation of \( u \) is like virtual displacement.
Three ways for static equilibrium

\[ \text{Min } PE = \int_0^L \left( \frac{1}{2} E(x) A(x) (u'(x))^2 - p(x) u(x) \right) dx \]

Minimum potential energy principle

\[ \delta y PE = \int_0^L \left( E(x) A(x) \delta u' - p(x) \delta u \right) dx = 0 \text{ for any } \delta u \]

Principle of virtual work;
The weak form

\[ \left( E A u' \right)' + p = 0 \]

Force balance;
And boundary conditions.
The strong form.

\[ EAu' = 0 \text{ or } \delta u = 0 \text{ at } x = 0 \]

\[ EAu' \text{ or } \delta u = 0 \text{ at } x = L \]

Q: What is “weak” about the weak form?
A: It needs derivative of one less order.
Example 2: is a straight line really the least-distance curve in a plane?

From Slide 7 in Lecture 3

\[
\text{Min } L = \int_{x_1}^{x_2} \sqrt{1 + y'^2} \, dx
\]

Data: \( x_1, x_2, y(x_1) = y_1, y(x_2) = y_2 \)

\[
\frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) = 0 \quad x \in (x_1, x_2)
\]

\[
0 - \frac{d}{dx} \left( \frac{y'}{\sqrt{1 + y'^2}} \right) = 0
\]

\[
\frac{y'}{\sqrt{1 + y'^2}} = C \quad \Rightarrow \quad y' = \text{constant}
\]

So, straight line in indeed the geodesic in a plane.
Example 3: Brachistochrone problem

From Slide 11 in Lecture 2

Minimize $T = \int_0^L \frac{\sqrt{1 + (y')^2}}{\sqrt{2g(H - y)}} \, dx$

$y(x)$

And we have Dirichlet (essential) boundary conditions at both the ends.
A functional with two derivatives: $F(y, y', y'')$

$$\min_{y(x)} J = \int_{x_1}^{x_2} F(y(x), y'(x), y''(x)) \, dx$$

$$\delta_y J = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y + \frac{\partial F}{\partial y'} \delta y' + \frac{\partial F}{\partial y''} \delta y'' \right\} \, dx = 0$$

First variation of $J$ w.r.t. $y(x)$.

We now need to integrate by parts twice to get rid of the second derivative of $y$. 
Integration by parts... twice!

\[\delta_y J = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y + \frac{\partial F}{\partial y'} \delta y' + \frac{\partial F}{\partial y''} \delta y'' \right\} \, dx = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y \right\} \, dx + \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y'} \delta y' \right\} \, dx + \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y''} \delta y'' \right\} \, dx = 0\]

\[\Rightarrow \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} \delta y \right\} \, dx + \frac{\partial F}{\partial y'} \bigg|_{x_1}^{x_2} \delta y' - \int_{x_1}^{x_2} \left\{ \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) \delta y \right\} \, dx + \frac{\partial F}{\partial y''} \bigg|_{x_1}^{x_2} \delta y'' \, dx = 0\]

\[\Rightarrow \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) + \frac{d^2}{dx^2} \left( \frac{\partial F}{\partial y''} \right) \right\} \delta y \, dx + \left( \frac{\partial F}{\partial y'} - \frac{d}{dx} \left( \frac{\partial F}{\partial y''} \right) \right) \bigg|_{x_1}^{x_2} \, \delta y' = 0\]

= 0 gives differential equation by using the fundamental lemma.

Two sets of boundary conditions

\[\frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) + \frac{d^2}{dx^2} \left( \frac{\partial F}{\partial y''} \right) = 0 \text{ for } x \in (x_1, x_2)\]
E-L equation and BCs for \( F(y, y', y'') \)

\[
\begin{align*}
\text{Min}_{y(x)} \quad & J = \int_{x_1}^{x_2} F\left( y(x), y'(x), y''(x) \right) dx \\
\frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) + \frac{d^2}{dx^2} \left( \frac{\partial F}{\partial y''} \right) &= 0 \quad \text{for} \quad x \in (x_1, x_2) \\
\left. \frac{\partial F}{\partial y'} - \frac{d}{dx} \left( \frac{\partial F}{\partial y''} \right) \right|_{x_1}^{x_2} &= 0 \\
\frac{\partial F}{\partial y''} \delta y' \bigg|_{x_1}^{x_2} &= 0 \\
\frac{\partial F}{\partial y'} \delta y'' \bigg|_{x_1}^{x_2} &= 0
\end{align*}
\]

Things are getting lengthy; let us use shorthand notation.

\[
\begin{align*}
\left. \frac{\partial F}{\partial y} = F_y' \right|_{x_1}^{x_2} &\quad \left. \frac{\partial F}{\partial y'} = F_y'' \right|_{x_1}^{x_2} &\quad \left. \frac{\partial F}{\partial y''} = F_y''' \right|_{x_1}^{x_2} \\
\left. \left( F_y' - (F_y'')' \right) \right|_{x_1}^{x_2} &= 0 \\
\left. F_y - (F_y')' + (F_y'')'' \right|_{x_1}^{x_2} &= 0
\end{align*}
\]

and

\[
\left. F_y'' \delta y' \right|_{x_1}^{x_2} = 0
\]
Example 4: beam deformation

From Slide 27 in Lecture 3

\[
\text{Min } PE = \int_0^L \left\{ \frac{1}{2} EI \left( \frac{d^2 w}{dx^2} \right)^2 - qw \right\} dx
\]

Data: \( q(x), E, I \)

When \( E \) and \( I \) are uniform, we get the familiar:

\[
F = \frac{1}{2} EI \left( \frac{d^2 w}{dx^2} \right)^2 - qw
\]

\[
F_y - (F_y')' + (F_y'')'' = 0
\]

\[
-q - 0 + (EIw'')'' = 0
\]

\[
\Rightarrow (EIw'')'' = q
\]

\[
EIw^{iv} = q
\]
Boundary conditions for the beam

\[ F = \frac{1}{2} EI \left( \frac{d^2 w}{dx^2} \right)^2 - qw (w(x)) \]

Physical interpretation

Either shear stress is zero or the transverse displacement is specified.

\[ \left( EI w'' \right)' \delta w \bigg|_0^L = 0 \]

Either bending moment is zero or the slope is specified.

\[ \left( F_y' - \left( F_y'' \right)' \right) \delta y \bigg|_{x_1}^{x_2} = 0 \]

\[ F_y'' \delta y' \bigg|_{x_1}^{x_2} = 0 \]
Do we see a trend for multiple derivatives in the functional?

\[
\text{Min } J = \int_{x_1}^{x_2} F(y(x), y'(x)) \, dx
\]

\[
F_y - \left( F_{y'} \right)' = 0
\]

\[
\left( F_{y'} \right) \delta y \bigg|_{x_1}^{x_2} = 0
\]
Three derivatives... \( F(y, y', y'', y''') \)

\[
\begin{align*}
\text{Min } J &= \int_{x_1}^{x_2} F\left(y(x), y'(x), y''(x), y'''(x)\right)dx \\
F - (F_y)' + (F_{y''})'' - (F_{y'''}))''' &= 0 \\
\left( F_y - (F_y')' + (F_{y''})'' \right) \delta y \bigg|_{x_1}^{x_2} &= 0, \quad \left( F_{y'} - (F_{y''})' \right) \delta y' \bigg|_{x_1}^{x_2} = 0 \text{ and} \\
F_{y''} \delta y'' \bigg|_{x_1}^{x_2} &= 0
\end{align*}
\]
Many derivatives... $F(y, y', y'', \ldots y^{(n)})$

$$\min_{y(x)} \int_{x_1}^{x_2} F\left(y(x), y'(x), y''(x), \ldots, y^{(n)}(x)\right) dx$$

$$F_y - (F_y')' + (F_y'')'' - (F_y'''')''' + \ldots = \sum_{i=0}^{n} (-1)^i \left(F_{y^{(i)}}\right)^{(i)} = 0$$

$$\left(\sum_{i=j}^{n} (-1)^{i-j} \left(F_{y^{(i)}}\right)^{(i-1)}\right) \delta y^{(j-1)} \quad \text{for} \quad j = 1, 2, \ldots n$$

Most general form with one function and many derivatives
What if we have two functions?

\[
\text{Min}_{y_1(x), y_2(x)} \quad J = \int_{x_1}^{x_2} F\left(y_1(x), y'_1(x), y_2(x), y'_2(x)\right) dx
\]

\[
\delta_{y_1} J = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y_1} \delta y_1 + \frac{\partial F}{\partial y'_1} \delta y'_1 \right\} dx = 0
\]

\[
\delta_{y_2} J = \int_{x_1}^{x_2} \left\{ \frac{\partial F}{\partial y_2} \delta y_2 + \frac{\partial F}{\partial y'_2} \delta y'_2 \right\} dx = 0
\]

Now, we need to take the first variation with respect to both the functions, separately.
What if we have two functions? (contd.)

\[
\begin{align*}
\text{Min} & \quad J = \int_{x_1}^{x_2} F \left( y_1(x), y'_1(x), y_2(x), y'_2(x) \right) dx \\
F \frac{y_1}{y'_1} - \left( F \frac{y'_1}{y'_1} \right)' &= 0 \quad \text{and} \quad \left( F \frac{y'_1}{y'_1} \right) \delta y_1 \bigg|_{x_1}^{x_2} = 0 \\
F \frac{y_2}{y'_2} - \left( F \frac{y'_2}{y'_2} \right)' &= 0 \quad \text{and} \quad \left( F \frac{y'_2}{y'_2} \right) \delta y_2 \bigg|_{x_1}^{x_2} = 0
\end{align*}
\]

And, we will have two differential equations and two sets of boundary conditions. Two unknown functions need two differential equations and two sets of BCs. That is all!
Most general form: \( m \) functions with \( n \) derivatives.

\[
\text{Min} \quad J = \int_{x_1}^{x_2} F\left(y_1, y'_1, \ldots, y_1^{(n)}, y_2, y'_2, \ldots, y_2^{(n)}, \ldots, y_m, y'_m, \ldots, y_m^{(n)}\right) dx
\]

\[
F_{y_k} - (F_{y'_k})' + (F_{y''_k})'' - (F_{y'''_k})''' + \ldots = \sum_{i=0}^{n} (-1)^i \left( F_{y_k^{(i)}} \right)^{(i)} = 0
\]

\[
\left( \sum_{i=j}^{n} (-1)^{i-j} \left( F_{y_k^{(i)}} \right)^{(i-1)} \right) \delta y_k^{(j-1)} \quad \text{for} \quad j = 1, 2, \ldots n
\]

The most general form when we have one independent variable \( x \).
The end note

Euler-Lagrange equations and their extension to multiple functions and multiple derivatives

- Euler-Lagrange equations = first variation + integration by parts + fundamental lemma

Boundary conditions
- Essential (Dirichlet)
- Natural (Neumann)

Dealing with multiple derivatives along with boundary conditions (need to do integration by parts as many times as the order of the highest derivative)

Dealing with multiple functions (rather easy)

General form of Euler-Lagrange equations in one independent variable
